

## Asp. Net Core MVC :-

An open-source, cross-platform, architectural design pattern based framework developed by Microsoft to create web Applications, RESTful supported web API's and CLI type of applications.

★ Server-side applications.

★ Supported windows, Linux, MacOS platform,

★ Supported web server: IIS, Kestrel

1. MVC Core Life cycle
2. Views and Return Types of Action Methods
3. ViewBag, ViewData and TempData Collection
4. Layout Pages, Bootstrap installation
5. Routing :- Conventional Based Routing  
Attribute Based Routing.
6. View Model
7. Partial Views
8. Asp. Net Tag Helper, and HTML Tag-helper
9. Filters
10. Sessions
11. ADO. Net → Connected & DCF / Code First  
Database First
12. Web API

Middleware :- functions

```
app.Use(async (context, next) => {
```

↳ This is custom middleware response.

```
    context.Response.WriteAsync("Hello HJ");
```

```
    await next(context);
```

```
    context.Response.WriteAsync("Hello world");
```

```
};
```

```
app.Run(async (context) => {
```

```
    context.Response.WriteAsync("H BS");
```

```
});
```

```
app.Run(); // host and run this appl.n
```

Browser

Home/Index/id  
request

1. Check appl.<sup>n</sup> Dir : root Dir  
2. Routing :-  
Route Table

"default"	" { 3 / { 3 "
"default"	" { 3 / { 3 / { id ! ?
"brs"	" { 3 / { 3 / { id ? 3 / { UN }
" "	" { 3 / { 3 / { UN } / { pw }

In this table: URL pattern : check  
If matches, next :-  
Split the URL :-  
arr = [ "controller" : "HomeController",  
"action" : "Index",  
"id" : "null ! ? 0",  
"UN" : "HJ",  
"pw" : "PWD" ]

## Conventional Based Routing:

```
app.mapDefaultControllerRoute();
```

```
app.mapControllerRoute (
```

```
  name: "default",
```

```
  pattern: "{-ctrl=home} / [action=Index] / [id?]"
```

```
);
```

1. ViewBag is dynamic object  
[ ViewData ]

→ ViewBag.KeyName = ???

this type get resolved at runtime.

→ ViewBag Data is local to that action method where we declared it. and can not be share between multiple action methods and hence can not pass to multiple views.
